Female 9.4%	5.67M	Michigan	2021
Male 8.4%	4.98M	Michigan	2021

Overall, it appears as if Michigan is aging. At the state level, almost every age bracket above 66 increased over the past 16 years, both for males and females. Most dramatically is an over 59% increase in the number of 79-74 males and a similar 58% increase in 79-74 year old females.

Interestingly, things are at the county level for 79-74 year old males with a 58% increase and 31% for the 79-74 year old females.

However, for both males and females aged 65 and 66, the population increased 59% and 116% respectively. Measuring the same bracket at the city of Warren level shows increases of 68% for males and 64% for females.

In general, 21 and under population has decreased across the board at all levels.

Most extreme at the state level is a 19% drop in 18-19 year old females and a 15% drop in 20-21 year old males. At the county level, things track similarly: a 12% drop in 18-19 year old females and a 13% drop in 20-21 year old males.

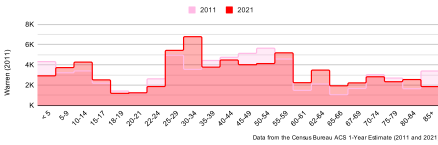

At the city level, things are more interesting. There are 6% more male under-5s but 32% less female under-5s. All males 24 and below have decreased, as dramatically as 46% down for 20-21 year olds. Female 22-24 year olds are down 29%.

There does exist a bit of an anomaly in Warren for one age bracket: 30-34 year old males and females are up 83% and 91% respectively, over quadrupling the positive growth seen at the county and state levels.

The aggregate male/female population comparisons between 2011 and 2021 showed very slight balance shifts with both Macomb County and Michigan seeing a 9.5% and 9.4% increase in males, but a 8.3% increase in females was observed in Warren.
